

Hello, my name is Carroll McCarroll. I have sixteen plus years of web development experience, working with many of the mainstream web technologies. I am equally versed in front-end and back-end development. I have also written several successful security models and management UI's for several applications. I love to learn and firmly believe, "If you can think of it, I can develop it."

PHP is my preferred server-side language, and have demonstrated proficiency in this language for years. I have an extensive knowledge of database design and several web application communication API's (SOAP, REST, Node-OPC-UA, etc.). My preferred JS framework is jQuery, but I have worked with several other frameworks and can also write old school JS. Bootstrap is my preferred CSS/JS framework, but I am well versed in Node, Gulp, LESS and Sass **preprocessors** for generation of custom, cross-browser, minified CSS files. I have worked with WordPress from time to time when required and have written several custom plugins and themes.

I have been a contract developer for several companies for many years working with several teams of various sizes serving as the lead a few times. Through this experience, I have learned best and worst practices for development, deployment and application design. I am analytical, creative and passionate about what I do. One of my greatest strengths is the ability to take a concept, understand the relational aspects of the data elements required and turn it into an elegant, user-friendly application. I have excellent communication skills as long as we're talking English, and I live in the US central time zone.

I believe a successful application should be easy to use, pleasing to the eye and feature rich. The key to making these three points into an equilateral triangle is presentation. Presentation should start off with a minimalist approach with features, access to details and advanced functions readily and intuitively available.

I have published some coding examples of my recent work that you can retrieve here:
